- Method Overriding
- Final Method & Class
- ~~Upcasting & Downcasting~~
- ~~Object class~~
    - ~~Methods of object class~~
        - ~~toString()~~
        - ~~equals() & hashCode()~~

Association

- If "has-a" relationship exist between the types, then use association.
- To implement association, we should declare instance/collection of inner class as a field inside another class.
- There are two types of associations
    - 1. Composition
    - 2. Aggregation

Composition

- Represents part-of relation i.e. tight coupling between the objects.
- The inner object is essential part of outer object.
- Heart is part of Human.
- Engine is part of Car.
- Wall is part of Room.
- joining date is a part of employee

Aggegration

- Represents has-a relation i.e. loose coupling between the objects.
- The inner object can be added, removed, or replaced easily in outer object.
- Car has a Driver.
- Company has Employees.
- Room has a window
- Employee has a vehicle

Inheritance

- If "is-a"/"kind-of" relationship exist between the types, then use inheritance.
- Inheritance is process of generalization to specialization.
- All members of parent class are inherited to the child class.
- Parent class is also called as super class and child class is also called as sub-class.

- Example:
    - Manager is a Employee
    - Mango is a Fruit
    - Rectangle is a Shape
- In Java, inheritance is done using extends keyword.
- Java doesn't support multiple implementation inheritance i.e. a class cannot be inherited from multiple super-classes.
- However Java does support multiple interface inheritance i.e. a class can be inherited from multiple super interfaces.

Super Keyword

- In sub-class, super-class members are referred using "super" keyword.
- used for calling super class constructor
- By default, when sub-class object is created, first super-class constructor (param-less) is executed and then sub-class constructor is executed.
- "super" keyword is used to explicitly call super-class constructor.
- Super class members (non-private) are accessible in sub-class directly or using "this" reference. These members can also be accessed using "super" keyword.
- However, if sub-class method signature is same as super-class signature, it hides/shadows method of the super class i.e. super-class method is not directly visible in sub-class.
- The "super" keyword is mandetory for accessing such hidden members of the super-class.

Types of Inheritance

- 1. Single

```
class A {

}
class B extends A{

}
```

- 2. Multiple

```
class A {

}
class B {

}
class C extends A,B{ // Not Allowed

}

interface A{
```

```
}
interface B{

}
interface C extends A,B{ // Allowed

}

class D implements A,B{ // Allowed

}
```

- 3. Hirerachical

```
class A {

}
class B extends A{

}
class C extends A{

}
```

- 4. Multilevel

```
class A {

}
class B extends A{

}
class C extends B{

}
```

- Hybrid inheritance: Any combination of above types

Method Overriding

- Redefining a super-class method in sub-class with exactly same signature is called as "Method overriding".

- Programmer should override a method in sub-class in one of the following scenarios

    - 1. Super-class has not provided method implementation at all (abstract method).

  - ○ 2. Super-class has provided partial method implementation and sub-class needs additional code. Here sub-class implementation may call super-class method (using super keyword).
  - ○ 3. Sub-class needs different implementation than that of super-class method implementation.

Rules of method overriding in Java

- 1. Each method in Java can be overridden unless it is private, static or final.
- 2. Sub-class method must have same or wider access modifier than super-class method.
- 3. Arguments of sub-class method must be same as of super-class method.
- 4. The return-type of sub-class method can be same or sub-class of the super- class's method's return-type. This is called as "covarient" return-type.
- 5. Checked exception list in sub-class method should be same or subset of exception list in super-class method.

- If these rules are not followed, compiler raises error or compiler treats sub-class method as a new method.

- Java 5.0 added @Override annotation (on sub-class method) informs compiler that programmer is intending to override the method from the super-class.

- @Override checks if sub-class method is compatible with corresponding super-class method or not (as per rules). If not compatible, it raise compile time error.

- Note that, @Override is not compulsory to override the method. But it is good practice as it improves readability and reduces human errors.

final Method

- If implementation of a super-class method is logically complete, then the method should be declared as final.
- Such final methods cannot be overridden in sub-class. Compiler raise error, if overridden.
- But final methods are inherited into sub-class i.e. The super-class final methods can be invoked in sub-class object (if accessible).

final Class

- If implementation of a super-class is logically complete, then the class should be declared as final.
- The final class cannot be extended into a sub-class. Compiler raise error, if inherited.
- Effectively all methods in final class are final methods.
- Examples of final classes
  - ○ java.lang.Integer (and all wrapper classes)
  - ○ java.lang.String
  - ○ java.lang.System
